<th>Management</th>
</tr>
</thead>
</table>
| Rash            | Any ARV drug can cause rash | Onset:  
- First few days to weeks after starting new ARV drug(s)  
Presentation:  
- Most rashes are mild-to-moderate, diffuse maculopapular eruptions.  
**Note:** A rash can be the initial manifestation of systemic hypersensitivity (see the SJS/TEN/EM Major and HSR sections below). | Common (>10%):  
- EFV  
- ETR  
- FTC  
- NVP  
Less Common (5% to 10%):  
- ABC  
- ATV  
- DRV  
- TDF  
Unusual (2% to 4%):  
- LPV/r  
- MVC  
- RAL  
- RPV | Sulfonamide allergy is a risk factor for rash in patients who are taking PIs that contain a sulfonamide moiety (e.g., DRV). Polymorphisms in CYP2B6 and multiple HLA loci may confer an increased risk of rash in patients who are taking NVP. | When Starting NVP or Restarting After Interruptions of >14 Days:  
- Utilize once-daily lead-in dosing.  
- Avoid the use of systemic corticosteroids during NVP dose escalation.  
- Assess patient for rash severity, mucosal involvement, and other signs of systemic reaction. | Mild-to-Moderate Maculopapular Rash Without Systemic or Mucosal Involvement:  
- Most rashes will resolve without intervention; ARV drugs can be continued while monitoring.  
- Antihistamines may provide some relief.  
Severe Rash and/or Rash Accompanied by Systemic Symptoms:  
- Manage as SJS/TEN/EM major, DRESS, or HSR as applicable (see below).  
Rash in Patients Receiving NVP:  
- Given the elevated risk of HSR, measure hepatic transaminases.  
- If hepatic transaminases are elevated, NVP should be discontinued and not restarted (see the HSR section below). |
| SJS/TEN/EM Major | Many ARV drugs, especially NNRTIs (see the Estimated Frequency column) | Onset:  
- First few days to weeks after starting new ARV drug(s)  
Presentation:  
- Initial rash may be mild, but it often becomes painful, evolving to blister/bulla formation with necrosis in severe cases. Usually involves mucous membrane ulceration and/or conjunctivitis. Systemic symptoms may also include fever, tachycardia, malaise, myalgia, and arthralgia.  
Case Reports:  
- ABC  
- ATV  
- DRV  
- LPV/r  
- RAL  
- ZDV | Infrequent:  
- NVP (0.3%)  
- EFV (0.1%)  
- ETR (<0.1%)  
**Adults:**  
- Female sex  
- Patients who are black, Asian, or Hispanic are at higher risk. | When Starting NVP or Restarting After Interruptions of >14 Days:  
- Utilize once-daily lead-in dosing.  
- Avoid the use of systemic corticosteroids during NVP dose escalation.  
- Assess patient for rash severity, mucosal involvement, and other signs of systemic reaction. | Discontinue all ARV drugs and other possible causative agents (e.g., TMP-SMX).  
Provide intensive supportive including care, IV hydration, aggressive wound care, eye care, labial adhesion preventative care, pain management, and antipyretics. Parenteral nutrition and antibiotics may also be necessary.  
Corticosteroids and/or IVIG are sometimes used, but the use of these interventions is controversial.  
Do not reintroduce the offending medication.  
When SJS/TEN/EM major occurs with the use of one NNRTI, many experts would avoid the use of other NNRTIs. |

<thead>
<tr>
<th>Adverse Effects</th>
<th>Associated ARVs</th>
<th>Onset/Clinical Manifestations</th>
<th>Estimated Frequency</th>
<th>Risk Factors</th>
<th>Prevention/ Monitoring</th>
<th>Management</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>DRESS</strong></td>
<td>DRV, DTG, EFV, ETR, NVP, RAL, RPV</td>
<td>Onset: • 1–8 weeks after starting new ARV drug(s)</td>
<td>Rare</td>
<td>Unknown</td>
<td>Obtain a CBC and AST, ALT, and creatinine levels from a patient who presents with suggestive symptoms.</td>
<td>Discontinue all ARV drugs and other possible causative agents (e.g., TMP-SMX). The role of systemic steroids in treatment unclear; consultation with a specialist is recommended. Provide supportive care for end-organ disease. <strong>Do not reintroduce</strong> the offending medication.</td>
</tr>
</tbody>
</table>
| **HSR**  
With or without skin involvement and excluding SJS/TEN | ABC | Onset  
*With First Use:* • Within first 6 weeks  
*With Reintroduction:* • Within hours | ≤1% to 9% (varies by ethnicity) | HLA-B*5701 (HSR is very uncommon in people who are HLA-B*5701 negative). The risk of HSR is higher in patients who are white compared to patients who are black or East Asian. | Screen for HLA-B*5701. **ABC should not be prescribed if HLA-B*5701 is present.** The medical record should clearly indicate that ABC is contraindicated. When starting ABC, counsel patients and families about the signs and symptoms of HSR to ensure prompt reporting of reactions. | Discontinue ARV drugs and investigate other causes of the symptoms (e.g., a concurrent viral illness). Provide symptomatic treatment. Most symptoms resolve within 48 hours after discontinuing ABC. **Do not rechallenge** with ABC even if the patient is HLA-B*5701 negative. |

<tr>
<td>HSR, continued</td>
<td>NVP</td>
<td>Onset:</td>
<td></td>
<td></td>
<td></td>
<td>Discontinue ARV drugs.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Occurs most frequently in the first few weeks of therapy, but can occur through 18 weeks</td>
<td></td>
<td></td>
<td></td>
<td>Consider other causes for hepatitis and discontinue all hepatotoxic medications. Provide supportive care as indicated and monitor the patient closely.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Presentation:</td>
<td></td>
<td></td>
<td></td>
<td>Do not re-introduce NVP. The safety of other NNRTIs is unknown following symptomatic hepatitis due to NVP, and many experts would avoid the NNRTI drug class when restarting treatment.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Flu-like symptoms (including nausea, vomiting, myalgia, fatigue, fever, abdominal pain, and jaundice) with or without skin rash that may progress to hepatic failure with encephalopathy</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Occurs in 4% of patients on average, with a range of 2.5% to 11%</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Adults:</td>
<td></td>
<td></td>
<td>When Starting NVP or Restarting After Interruptions of &gt;14 Days:</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Treatment-naive with a higher CD4 count (&gt;250 cells/mm³ in women; &gt;400 cells/mm³ in men)</td>
<td></td>
<td></td>
<td>• A 2-week lead-in period with once-daily dosing, followed by dose escalation to twice daily as recommended, may reduce the risk of reaction. This may not be necessary in children aged &lt;2 years.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Female sex (risk is three-fold higher in females than in males)</td>
<td></td>
<td></td>
<td>• Counsel families about signs and symptoms of HSR to ensure prompt reporting of reactions.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Children:</td>
<td></td>
<td></td>
<td>Obtain AST and ALT levels in patients with rash. Obtain AST and ALT levels at baseline, before dose escalation, 2 weeks after dose escalation, and thereafter at 3-month intervals.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• NVP hepatotoxicity and HSR are less common in prepubertal children than in adults, and both are uncommon in infants.</td>
<td></td>
<td></td>
<td>• Avoid NVP use in women with CD4 counts &gt;250 cells/mm³ and in men with CD4 counts &gt;400 cells/mm³, unless benefits outweigh risks.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• High CD4 percentage is associated with an increased risk of NVP toxicity. In the PREDICT study, the risk of NVP toxicity (rash, hepatotoxicity, hypersensitivity) was 2.65 times greater in children who had CD4 percentages ≥15% than in children who had CD4 percentages &lt;15%.</td>
<td></td>
<td></td>
<td>• Do not use NVP as PEP outside of the neonatal period.</td>
<td></td>
</tr>

---

*a The prescribing information for NVP states that patients who experience rash during the 14-day lead-in period should not have the NVP dose increased until the rash has resolved. However, prolonging the lead-in phase beyond 14 days may increase the risk of NVP resistance because of subtherapeutic drug levels. Children who have persistent mild or moderate rash after the lead-in period should receive individualized care. Consult an expert in HIV care when managing these patients. **NVP should be stopped and not restarted** if the rash is severe or progressing. See the NVP section of the Drug Appendix.

*b Lead-in dosing **is not recommended** when using nevirapine for either empiric or definitive HIV therapy in newborns with perinatal HIV exposure or perinatal HIV. See the NVP section of the Drug Appendix and Table 12.

**Key to Acronyms:**  
ABC = abacavir; ALT = alanine transaminase; ARV = antiretroviral; AST = aspartate aminotransferase; ATV = atazanavir; CBC = complete blood count; CD4 = CD4 T lymphocyte; CYP = cytochrome P450; DRESS = drug reaction (or rash) with eosinophilia and systemic symptoms; DRV = darunavir; DTG = dolutegravir; EFV = efavirenz; EM = erythema multiforme; ETR = etravirine; FTC = emtricitabine; HLA = human leukocyte antigen; HSR = hypersensitivity reaction; IV = intravenous; IVIG = intravenous immune globulin; LPV/r = lopinavir/ritonavir; MVC = maraviroc; NNRTI = non-nucleoside reverse transcriptase inhibitor; NVP = nevirapine; PEP = post-exposure prophylaxis; PI = protease inhibitor; RAL = raltegravir; RPV = rilpivirine; SJS = Stevens-Johnson syndrome; TDF = tenofovir disoproxil fumarate; TEN = toxic epidermal necrolysis; TMP-SMX = trimethoprim-sulfamethoxazole; ZDV = zidovudine
