Emtricitabine (Emtriva, FTC)

(Last updated December 24, 2019; last reviewed December 24, 2019)

Animal Studies

Carcinogenicity

Emtricitabine (FTC) was neither mutagenic nor clastogenic in a series of in vitro and animal in vivo screening tests. In long-term carcinogenicity studies of oral FTC, no drug-related increases in tumor incidence were found at doses up to 26 times (in mice) or 31 times (in rats) the exposures seen in humans who received the therapeutic dose.1

Reproduction/Fertility

FTC had no observable effect on reproduction or fertility at doses that produced systemic drug exposures (as measured by area under the curve [AUC]) that were approximately 60-fold higher in female and male mice and 140-fold higher in male rats than human exposure at the recommended therapeutic dose.1

Teratogenicity/Adverse Pregnancy Outcomes

No fetal variations or malformations were observed following maternal FTC doses that produced systemic drug exposures that were 60-fold higher (in mice) or 120-fold higher (in rabbits) than those observed in humans who received the recommended dose.1

Placental and Breast Milk Passage

FTC has been shown to cross the placenta in mice and rabbits; the average fetal/maternal drug concentration ratio was 0.4 in mice and 0.5 in rabbits.2

Human Studies in Pregnancy

Pharmacokinetics

In the IMPAACT P1026s study, FTC exposure was modestly lower during the third trimester (geometric mean 8.0 mcg·h/mL; 90% confidence interval [CI], 7.1–8.9 mcg·h/mL) than during the postpartum period (9.7 mcg·h/mL; 90% CI, 8.6–10.9 mcg·h/mL). Fifty-eight percent of pregnant women (15 of 26 women) met the AUC target (≤30% reduction from typical exposure for nonpregnant historical controls) compared to 95% of postpartum women (21 of 22 women). Trough FTC levels were also lower during pregnancy (C24h geometric mean concentration [GMC] 58 ng/mL; 90% CI, 37–63 ng/mL) than during the postpartum period (C24h GMC 85 ng/mL; 90% CI, 70–100 ng/mL).3 Similar differences in pharmacokinetic parameters of FTC were found among women during pregnancy or after delivery in the PACTG 394 study4 and in a European study.5,6 The increase in FTC clearance during pregnancy correlated with the normal pregnancy-related increase in glomerular filtration rate.6 These changes are not believed to be large enough to warrant a dose adjustment during pregnancy.

Placental and Breast Milk Passage

FTC has been shown to have high placental transfer in pregnant women. In a study of 15 women who received FTC during pregnancy, the mean cord blood-to-maternal-plasma ratio was 1.2 (90% CI, 1.0–1.5).3 In eight women who were given a single dose of FTC 600 mg with tenofovir disoproxil fumarate (TDF) 900 mg, the median cord blood FTC concentration was 717 ng/mL (range 21–1,072 ng/mL), and the median cord blood-to-maternal-plasma ratio was 0.85 (range 0.46–1.07).4

FTC is excreted into human milk. Among women in Uganda and Nigeria who were taking first-line antiretroviral therapy that contained FTC 200 mg, FTC concentrations in breast milk peaked later than they did in maternal plasma (at 4–8 hours compared with 2–4 hours) and were three-fold higher than maternal plasma concentrations. FTC was detectable in three infants (19%).7 In a study in the Ivory Coast, five women with HIV who exclusively breastfed their newborn infants were given FTC 400 mg, TDF 600 mg,
and nevirapine 200 mg at onset of labor, followed by FTC 200 mg and TDF 300 mg once daily for 7 days postpartum. The median minimal and maximal concentrations of FTC in breast milk were 177 ng/mL and 679 ng/mL, respectively (interquartile ranges [IQR] 105–254 ng/mL and 658–743 ng/mL, respectively), well above the estimated FTC IC₅₀ for HIV-1.⁸ In a study of 50 women without HIV who received daily oral FTC 200 mg and TDF 300 mg as pre-exposure prophylaxis (PrEP), median peak and trough breast milk concentrations of FTC were 212.5 ng/mL (IQR 140.0–405.0 ng/mL) and 183.0 ng/mL (IQR 113.0–250.0 ng/mL), respectively. FTC was detectable in 47 of 49 infants at a median concentration of 13.2 ng/mL (IQR 9.3–16.7 ng/mL), corresponding to estimated daily infant ingestion of a 31.9-mcg/kg dose (IQR 21.0–60.8 mcg/kg) of FTC, or 0.5% of the daily dose for treating infants.⁹

Teratogenicity/Adverse Pregnancy Outcomes

A study of pregnancies conducted during an HIV PrEP trial randomized participants without HIV to receive placebo, TDF, or TDF plus FTC. No increase in the incidence of congenital anomalies was observed in the TDF plus FTC arm.¹⁰ There was no overall difference between the rate of pregnancy loss in the TDF plus FTC arm and the rate of pregnancy loss in the TDF arm of this PrEP study.

In the U.S. PHACS/SMARTT cohort study, FTC exposure was not associated with an increase in specific or overall birth defect risk.¹¹ In a large French cohort, FTC exposure in the first trimester was associated with lower risk of birth defects.¹² In the Antiretroviral Pregnancy Registry, sufficient numbers of first-trimester exposures to FTC have been monitored to be able to detect at least a 1.5-fold increased risk of overall birth defects and a two-fold increase in cardiovascular and genitourinary defects. No such increase in birth defects has been observed with FTC. Among the cases of first-trimester FTC exposure that have been reported to the Antiretroviral Pregnancy Registry, the prevalence of birth defects was 2.44% (77 of 3,158 births; 95% CI, 1.93% to 3.04%), compared with a total prevalence of 2.72% in the U.S. population, based on Centers for Disease Control and Prevention surveillance.¹³

Other Safety Information

In the U.S. PHACS/SMARTT cohort study, after adjusting for birth cohort and other factors, maternal use of FTC led to no increase in the likelihood of adverse metabolic, growth and development, cardiac, neurological, or neurodevelopmental outcomes.¹⁴
Excerpt from Table 8

Note: When using FDC tablets, refer to other sections in Appendix B and Table 8 for information about the dosing and safety of individual drug components of the FDC tablet during pregnancy.

| Emtricitabine (FTC) Emtriva | FTC (Emtriva) Capsule:<sup>d</sup> • 200 mg Oral Solution: • 10 mg/mL FTC/EFV/TDF (Atripla):<sup>c</sup> • FTC 200 mg/EFV 600 mg/TDF 300 mg tablet FTC/BIC/TAF (Biktarvy): • FTC 200 mg/BIC 50 mg/TAF 25 mg tablet FTC/RPV/TDF (Complera): • FTC 200 mg/RPV 25 mg/TDF 300 mg tablet FTC/TAF (Descovy): • FTC 200 mg/TAF 25 mg tablet FTC/EVG/c/TAF (Genvoya): • FTC 200 mg/EVG 150 mg/COBI 150 mg/TAF 10 mg tablet FTC/RPV/TAF (Odefsey): • FTC 200 mg/RPV 25 mg/TAF 25 mg tablet FTC/EVG/c/TDF (Stribild): • FTC 200 mg/EVG 150 mg/COBI 150 mg/TDF 300 mg tablet FTC/DRV/c/TAF (Symtuza): • FTC 200 mg/DRV 800 mg/COBI 150 mg/TAF 10 mg tablet FTC/TDF (Truvada):<sup>c</sup> • FTC 200 mg/TDF 300 mg tablet Standard Adult Doses FTC (Emtriva) Capsule: • FTC 200 mg once daily without regard to food Oral Solution: • FTC 240 mg (24 mL) once daily without regard to food FTC/EFV/TDF (Atripla): • One tablet once daily at or before bedtime • Take on an empty stomach to reduce or mitigate side effects. FTC/BIC/TAF (Biktarvy): • One tablet once daily with or without food FTC/RPV/TDF (Complera): • One tablet once daily with food FTC/TAF (Descovy): • One tablet once daily with or without food FTC/EVG/c/TAF (Genvoya): • One tablet once daily with food FTC/RPV/TAF (Odefsey): • One tablet once daily with food FTC/EVG/c/TDF (Stribild): • One tablet once daily with food FTC/DRV/c/TAF (Symtuza): • One tablet once daily with food FTC/TDF (Truvada): • One tablet once daily without regard to food Pregnancy PKs in Pregnancy: • PKs of FTC are not significantly altered in pregnancy. Dosing in Pregnancy: • No change in dose indicated. For guidance about the use of combination products in pregnancy, please see the specific sections on other components (i.e., TDF, TAF, EFV, RPV, DRV, EVG, BIC, COBI).

- High placental transfer to fetus.<sup>b</sup> No evidence of human teratogenicity (can rule out 1.5-fold increase in overall birth defects). If patient has HBV/HIV coinfection, it is possible that a HBV flare may occur if the drug is stopped; see Hepatitis B Virus/HIV Coinfection.

<sup>a</sup> Individual ARV drug doses may need to be adjusted in patients with renal or hepatic insufficiency (for details, see the Adult and Adolescent Antiretroviral Guidelines, Appendix B, Table 10).

<sup>b</sup> Placental transfer categories are determined by mean or median cord blood/maternal delivery plasma drug ratio:

- High: >0.6
- Moderate: 0.3–0.6
- Low: <0.3

<sup>c</sup> Generic product is available.

Key: BIC = bictegravir; COBI = cobicistat; DRV/c = darunavir/cobicistat; EFV = efavirenz; EVG/c = elvitegravir/cobicistat; FDC = fixed-dose combination; FTC = emtricitabine; HBV = hepatitis B virus; PK = pharmacokinetic; RPV = rilpivirine; TAF = tenofovir alafenamide; TDF = tenofovir disoproxil fumarate.
