</thead>
</table>
| **Bacterial Enteric Infections** | Diagnostic fecal specimens should be obtained before initiation of empiric antibiotic therapy. If culture is positive, antibiotic susceptibilities should be performed to inform antibiotic choices given increased reports of antibiotic resistance. If a culture independent diagnostic test is positive, reflex cultures for antibiotic susceptibilities should also be done. Empiric antibiotic therapy is indicated for advanced HIV patients (CD4 count <200 cells/µL or concomitant AIDS-defining illnesses), with clinically severe diarrhea (≥6 stools/day or bloody stool) and/or accompanying fever or chills. | Empiric Therapy:  
• Ciprofloxacin 500–750 mg PO (or 400 mg IV) q12h (AIII)  
Therapy should be adjusted based on the results of diagnostic work-up.  
For patients with chronic diarrhea (>14 days) without severe clinical signs, empiric antibiotics therapy is not necessary, can withhold treatment until a diagnosis is made. | Oral or IV rehydration (if indicated) should be given to patients with diarrhea (AIII).  
Antimotility agents should be avoided if there is concern about inflammatory diarrhea, including *Clostridium-difficile*-associated diarrhea (BIII).  
If no clinical response after 3-4 days, consider follow-up stool culture with antibiotic susceptibility testing or alternative diagnostic tests (e.g., toxin assays, molecular testing) to evaluate alternative diagnosis, antibiotic resistance, or drug-drug interactions.  
IV antibiotics and hospitalization should be considered in patients with marked nausea, vomiting, diarrhea, electrolyte abnormalities, acidosis, and blood pressure instability. |

Empiric Therapy pending definitive diagnosis |  
Diagnostic fecal specimens should be obtained before initiation of empiric antibiotic therapy. If culture is positive, antibiotic susceptibilities should be performed to inform antibiotic choices given increased reports of antibiotic resistance. If a culture independent diagnostic test is positive, reflex cultures for antibiotic susceptibilities should also be done.  
Empiric antibiotic therapy is indicated for advanced HIV patients (CD4 count <200 cells/µL or concomitant AIDS-defining illnesses), with clinically severe diarrhea (≥6 stools/day or bloody stool) and/or accompanying fever or chills. |  
Empiric Therapy:  
• Ceftriaxone 1 g IV q24h (BIII),  
or  
• Cefotaxime 1 g IV q8h (BIII) |  
Oral or IV rehydration (if indicated) should be given to patients with diarrhea (AIII).  
Antimotility agents should be avoided if there is concern about inflammatory diarrhea, including *Clostridium-difficile*-associated diarrhea (BIII).  
If no clinical response after 3-4 days, consider follow-up stool culture with antibiotic susceptibility testing or alternative diagnostic tests (e.g., toxin assays, molecular testing) to evaluate alternative diagnosis, antibiotic resistance, or drug-drug interactions.  
IV antibiotics and hospitalization should be considered in patients with marked nausea, vomiting, diarrhea, electrolyte abnormalities, acidosis, and blood pressure instability. |

<table>
<thead>
<tr>
<th>Opportunistic Infection</th>
<th>Preferred Therapy</th>
<th>Alternative Therapy</th>
<th>Other Comments</th>
</tr>
</thead>
</table>
| **Campylobacteriosis** | For Mild Disease and If CD4 Count >200 cells/µL:  
• No therapy unless symptoms persist for more than several days (CIII)  
For Mild-to-Moderate Disease Disease (If Susceptible):  
• Ciprofloxacin 500–750 mg PO (or 400 mg IV) q12h (BIII), or  
• Azithromycin 500 mg PO daily (BIII) (Note: Not for patients with bacteremia (AIII))  
For *Campylobacter* Bacteremia:  
• Ciprofloxacin 500–750 mg PO (or 400 mg IV) q12h (BIII) + an aminoglycoside (BIII)  
Duration of Therapy:  
• Gastroenteritis: 7–10 days (AIII) (5 days with azithromycin)  
• Bacteremia: ≥14 days (BIII)  
• Recurrent bacteremia: 2–6 weeks (BIII) | For Mild-to-Moderate Disease (If Susceptible):  
• Levofloxacin 750 mg (PO or IV) q24h (BIII),  
or  
• Moxifloxacin 400 mg (PO or IV) q24h (BIII)  
Add an aminoglycoside to fluoroquinolone in bacteremic patients (BIII). | Oral or IV rehydration if indicated (AIII).  
Antimotility agents should be avoided (BIII).  
If no clinical response after 5–7 days, consider follow-up stool culture, alternative diagnosis, or antibiotic resistance.  
There is an increasing rate of fluoroquinolone resistance in the United States (24% resistance in 2011).  
The rationale of addition of an aminoglycoside to a fluoroquinolone in bacteremic patients is to prevent emergence of quinolone resistance.  
Effective ART may reduce the frequency, severity, and recurrence of campylobacter infections. |

</thead>
<tbody>
<tr>
<td><strong>Bacterial Enteric Infections, continued</strong></td>
<td><em>Clostridium difficile Infection (CDI)</em></td>
<td>Vancomycin 125 mg (PO) QID for 10–14 days (A1) For severe, life-threatening CDI, see text and references for additional information.</td>
<td>For mild, outpatient disease: metronidazole 500 mg (PO) TID for 10–14 days (CII). Recurrent CDI: Treatment is the same as in patients without HIV infection. Fecal microbiota therapy may be successful and safe to treat recurrent CDI in HIV-infected patients (CIII). See text and references for additional information.</td>
</tr>
<tr>
<td><strong>Salmonellosis</strong></td>
<td>All HIV-infected patients with salmonellosis should receive antimicrobial treatment due to an increase of bacteremia (by 20-100 fold) and mortality (by up to 7-fold) compared to HIV-negative individuals (AIII). Oral or IV rehydration if indicated (AIII). Antimotility agents should be avoided (BIII). The role of long-term secondary prophylaxis in patients with recurrent <em>Salmonella</em> bacteremia is not well established. Must weigh benefit against risks of long-term antibiotic exposure (BIII). Effective ART may reduce the frequency, severity, and recurrence of salmonella infections.</td>
<td>Ciprofloxacin 500–750 mg PO (or 400 mg IV) q12h, if susceptible (AIII) Duration of Therapy: For gastroenteritis without bacteremia: • If CD4 count ≥200 cells/µL: 7–14 days (BIII) • If CD4 count &lt;200 cells/µL: 2–6 weeks (BIII) For gastroenteritis with bacteremia: • If CD4 count ≥200/µL: 14 days or longer duration if bacteremia persists or if the infection is complicated (e.g., if metastatic foci of infection are present) (BIII) • If CD4 count &lt;200 cells/µL: 2–6 weeks (BIII) Secondary Prophylaxis Should Be Considered For: • Patients with recurrent <em>Salmonella</em> gastroenteritis +/- bacteremia (CIII), or • Patients with CD4 &lt;200 cells/µL with severe diarrhea (CIII)</td>
<td></td>

<tr>
<td>Bacterial Enteric Infections, continued</td>
<td>Shigellosis</td>
<td>• Ciprofloxacin 500–750 mg PO (or 400 mg IV) q12h (AII)</td>
<td>• Levofloxacin 750 mg (PO or IV) q24h (BIII), or</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Duration of Therapy:</strong></td>
<td><strong>Therapy is indicated both to shorten duration of illness and prevent spread of infection (AII).</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Gastroenteritis: 7–10 days (AII) (if azithromycin is used, treat for 5 days)</td>
<td><strong>Given increasing antimicrobial resistance and limited data showing that antibiotic therapy limits transmission, antibiotic treatment may be withheld in patients with CD4 &gt;500 cells/mm³ whose diarrhea resolves prior to culture confirmation of Shigella infection (CIII).</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Bacteremia: ≥14 days (BIII)</td>
<td><strong>Oral or IV rehydration if indicated (AIII).</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Recurrent Infections: up to 6 weeks (BIII)</td>
<td><strong>Antimotility agents should be avoided (BIII).</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong> Increased resistance of Shigella to fluoroquinolones is occurring in the United States. Avoid fluoroquinolones if ciprofloxacin MIC is ≥0.12 ug/ml even if the laboratory identifies the isolate as sensitive. Many Shigella strains resistant to fluoroquinolones exhibit resistance to other commonly used antibiotics. Thus, antibiotic sensitivity testing of Shigella isolates from HIV-infected individuals should be performed routinely.</td>
<td><strong>If no clinical response after 5–7 days, consider follow-up stool culture, alternative diagnosis, or antibiotic resistance.</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong> Azithromycin-resistant Shigella spp has been reported in HIV-infected MSM.</td>
<td><strong>Effective ART may decrease the risk of recurrence of Shigella infections.</strong></td>
</tr>
</tbody>
</table>

Bartonellosis

For Bacillary Angiomatosis, Peliosis Hepatis, Bacteremia, and Osteomyelitis:
• Doxycycline 100 mg PO or IV q12h (AII), or
• Erythromycin 500 mg PO or IV q6h (AII)
CNS Infections:
• (Doxycycline 100 mg +/- RIF 300 mg) PO or IV q12h (AII)
Confirmed Bartonella Endocarditis:
• (Doxycycline 100 mg IV q12h + gentamicin 1 mg/kg IV q8h) for 2 weeks, then continue with doxycycline 100 mg IV or PO q12h (BIII)
Other Severe Infections:
• (Doxycycline 100 mg PO or IV +/- RIF 300 mg PO or IV) q12h (BIII), or
• (Erythromycin 500 mg PO or IV q6h) +/- RIF 300 mg PO or IV q12h (BIII)
**Duration of Therapy:**
• At least 3 months (AII)
For Bacillary Angiomatosis, Peliosis Hepatis, Bacteremia, And Osteomyelitis:
• Azithromycin 500 mg PO daily (BII) | **When RIF is used, take into consideration the potential for significant interaction with ARV drugs and other medications (see Table 5 for dosing recommendations).** |
| | | • Clarithromycin 500 mg PO BID (BII) | **If relapse occurs after initial (>3 month) course of therapy, long-term suppression with doxycycline or a macrolide is recommended as long as CD4 count <200 cells/µL (AII).** |
| | | Confirmed Bartonella Endocarditis but with Renal Insufficiency:
• (Doxycycline 100 mg IV + RIF 300 mg PO or IV) q12h for 2 weeks, then continue with doxycycline 100 mg IV or PI q12h (BIII) | |

</thead>
</table>
| Candidiasis (Mucocutaneous) | For Oropharyngeal Candidiasis: Initial Episodes (For 7–14 Days):  
  Oral Therapy  
  • Fluconazole 100 mg PO daily (AI)  
| For Esophageal Candidiasis (For 14–21 Days):  
  • Fluconazole 100 mg (up to 400 mg) PO or IV daily (AI), or  
  • Itraconazole oral solution 200 mg PO daily (AI)  
| For Uncomplicated Vulvo-Vaginal Candidiasis:  
  • Oral fluconazole 150 mg for 1 dose (AI), or  
  • Topical azoles ( clotrimazole, butoconazole, miconazole, tioconazole, or terconazole) for 3–7 days (AI)  
| For Severe or Recurrent Vulvo-Vaginal Candidiasis:  
  • Fluconazole 100–200 mg PO daily for ≥7 days (AI), or  
  • Topical antifungal ≥7 days (AI)  
| For Oropharyngeal Candidiasis: Initial Episodes (For 7–14 Days):  
  Oral Therapy  
  • Itraconazole oral solution 200 mg PO daily (BI), or  
  • Posaconazole oral suspension 400 mg PO BID for 1 day, then 400 mg daily (BI)  
| Topical Therapy  
  • Clotrimazole troches, 10 mg PO 5 times daily (BI), or  
  • Miconazole mucoadhesive buccal 50-mg tablet—apply to mucosal surface over the canine fossa once daily (do not swallow, chew, or crush) (BI), or  
  • Nystatin suspension 4–6 mL QID or 1–2 flavored pastilles 4–5 times daily (BII)  
| For Esophageal Candidiasis (For 14–21 Days):  
  • Voriconazole 200 mg PO or IV BID (BI), or  
  • Isavuconazole 200 mg PO as a loading dose, followed by 50 mg PO daily (BI), or  
  • Isavuconazole 400 mg PO as a loading dose, followed by 100 mg PO daily (BI), or  
  • Isavuconazole 400 mg PO once-weekly (BI), or  
  • Anidulafungin 100 mg IV 1 time, then 50 mg IV daily (BI), or  
  • Caspofungin 50 mg IV daily (BI), or  
  • Micafungin 150 mg IV daily (BI), or  
  • Amphotericin B deoxycholate 0.6 mg/kg IV daily (BI), or  
  • Lipid formulation of amphotericin B 3–4 mg/kg IV daily (BIII)  
| For Uncomplicated Vulvo-Vaginal Candidiasis:  
  • Itraconazole oral solution 200 mg PO daily for 3–7 days (BII)  
| Chronic or prolonged use of azoles may promote development of resistance.  
| Higher relapse rate for esophageal candidiasis seen with echinocandins than with fluconazole use.  
| Suppressive therapy usually not recommended (BIII) unless patients have frequent or severe recurrences.  
| If Decision Is to Use Suppressive Therapy:  
  Oropharyngeal candidiasis:  
  • Fluconazole 100 mg PO daily or three times weekly (BI), or  
  • Itraconazole oral solution 200 mg PO daily (CI)  
| Esophageal candidiasis:  
  • Fluconazole 100–200 mg PO daily (BI), or  
  • Posaconazole 400 mg PO BID (BII)  
| Vulvo-vaginal candidiasis:  
  • Fluconazole 150 mg PO once weekly (CII)

<td><strong>Chagas Disease</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>For Acute, Early Chronic, and Reactivated Disease:</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>• Benznidazole 5–8 mg/kg/day PO in 2 divided doses for 30–60 days (BIII) (not commercially available in the United States; contact the CDC Drug Service at <a href="mailto:drugservice@cdc.gov">drugservice@cdc.gov</a> or (404) 639-3670, or the CDC emergency operations center at (770) 488-7100)</td>
<td>For Acute, Early Chronic, and Reactivated Disease</td>
<td>Nifurtimox 8–10 mg/kg/day PO for 90–120 days (CIII) (not commercially available in the U.S., contact the CDC Drug Service at <a href="mailto:drugservice@cdc.gov">drugservice@cdc.gov</a> or (404) 639-3670, or the CDC emergency operations center at (770) 488-7100)</td>
<td>Treatment is effective in reducing parasitemia and preventing clinical symptoms or slowing disease progression. It is ineffective in achieving patholological cure. Duration of therapy has not been studied in HIV-infected patients. Initiate or optimize ART in patients undergoing treatment for Chagas disease, once they are clinically stable (AIII).</td>
</tr>
<tr>
<td><strong>Coccidioidomycosis</strong></td>
<td>Clinically Mild Infections (e.g., Focal Pneumonia):</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• Fluconazole 400 mg* PO daily (AII), or</td>
<td></td>
<td>Mild Infections (Focal Pneumonia):</td>
<td>Relapse can occur in 25%–33% of HIV-negative patients with diffuse pulmonary or disseminated diseases. Therapy should be given for at least 12 months and usually much longer; discontinuation is dependent on clinical and serological response and should be made in consultation with experts (BIII).</td>
</tr>
<tr>
<td>• Itraconazole 200 mg* PO BID (BII)</td>
<td>For Patients Who Failed to Respond to Fluconazole or Itraconazole:</td>
<td></td>
<td>Therapy should be lifelong in patients with meningeal infections because relapse occurs in 80% of HIV-infected patients after discontinuation of triazole therapy (AII).</td>
</tr>
<tr>
<td>Bone or Joint Infections:</td>
<td>• Posaconazole 300 mg delayed-release tablet* PO BID x 1 day, then once daily (BIII), or</td>
<td>• Posaconazole 400 mg oral suspension* PO BID (BII), or</td>
<td>*Fluconazole, itraconazole, posaconazole, and voriconazole may have significant interactions with other medications including ARV drugs. These interactions are complex and can be bi-directional. Refer to Table 5 or Antiretroviral guidelines for dosage recommendations. Therapeutic drug monitoring and dosage adjustment may be necessary to ensure triazole antifungal and antiretroviral efficacy and reduce concentration-related toxicities. Intraphecal amphotericin B should only be given in consultation with a specialist and administered by an individual with experience with the technique.</td>
</tr>
<tr>
<td>• Itraconazole 200 mg* PO BID (AII)</td>
<td>• Voriconazole 200 mg* PO BID (BIII)</td>
<td>• Posaconazole 300 mg delayed-release tablet* PO BID x 1 day, then once daily (CIII), or</td>
<td></td>
</tr>
<tr>
<td>Severe, Non-Meningeal Infection (Diffuse Pulmonary Infection or Severely Ill Patients with Extrathoracic, Disseminated Disease):</td>
<td></td>

<thead>
<tr>
<th>Opportunistic Infection</th>
<th>Preferred Therapy</th>
<th>Alternative Therapy</th>
<th>Other Comments</th>
</tr>
</thead>
</table>
| **Community-Acquired Pneumonia (CAP)**         | Empiric antibiotic therapy should be initiated promptly for patients presenting with clinical and radiographic evidence consistent with bacterial pneumonia. The recommendations listed are suggested empiric therapy. The regimen should be modified as needed once microbiologic results are available (BIII). Providers must also consider the risk of opportunistic lung infections (e.g., PCP, TB), which may alter the empiric therapy. | Empiric antibiotic therapy should be initiated promptly for patients presenting with clinical and radiographic evidence consistent with bacterial pneumonia. The recommendations listed are suggested empiric therapy. The regimen should be modified as needed once microbiologic results are available (BIII). Providers must also consider the risk of opportunistic lung infections (e.g., PCP, TB), which may alter the empiric therapy. | Duration:  
• For most patients, 5–7 days.  
• Patients should be afebrile for 48–72 hours and clinically stable before stopping antibiotics.  
• Longer duration is often required if severe CAP or bacteremia is present, and particularly if due to *S. pneumoniae* or complicated *S. aureus* pneumonia.  
Fluoroquinolones should be used with caution in patients in whom TB is suspected but is not being treated.  
Empiric therapy with a macrolide alone is not routinely recommended, because of increasing pneumococcal resistance (up to 30%) (BIII).  
Patients receiving a macrolide for MAC prophylaxis may have bacterial resistance to macrolide due to chronic exposure  
For patients begun on IV antibiotic therapy, switching to PO should be considered when they are clinically improved and able to tolerate oral medications.  
Antibiotic chemoprophylaxis is generally not recommended because of the potential for developing drug resistance and drug toxicities (AI). |

Empiric Outpatient Therapy:  
• A PO beta-lactam plus a PO macrolide (azithromycin or clarithromycin) (AII)  
**Preferred Beta-Lactams:**  
• High-dose amoxicillin or amoxicillin/clavulanate  
**Alternative Beta-Lactams:**  
• Cefpodoxime or cefuroxime, or  
• Levofoxacin 750 mg PO once daily (AII), or moxifloxacin 400 mg PO once daily (AII), especially for patients with penicillin allergies.  
Empiric Therapy for Hospitalized Patients with Non-Severe CAP:  
• An IV beta-lactam plus a macrolide (azithromycin or clarithromycin) (AI)  
**Preferred Beta-Lactams:**  
• Ceftriaxone, cefotaxime, or ampicillin-sulbactam  
**Alternative Beta-Lactams:**  
• Levofoxacin 750 mg IV once daily (AI), or moxifloxacin, 400 mg IV once daily (AI), especially for patients with penicillin allergies.  
Empiric Therapy for Hospitalized Patients with Severe CAP:  
• An IV beta-lactam plus IV azithromycin (AI), or  
• An IV beta-lactam plus (levofloxacin 750 mg IV once daily or moxifloxacin 400 mg IV once daily) (AI)  
**Preferred Beta-Lactams:**  
• Ceftriaxone, cefotaxime, or ampicillin-sulbactam  
<p>|</p>
<table>
<thead>
<tr>
<th>Opportunistic Infection</th>
<th>Preferred Therapy</th>
<th>Alternative Therapy</th>
<th>Other Comments</th>
</tr>
</thead>
</table>
| Community-Acquired Pneumonia (CAP), continued | Empiric Therapy for Patients at Risk of *Pseudomonas* Pneumonia:  
- An IV antipseudomonal beta-lactam plus (ciprofloxacin 400 mg IV every 8–12 hours or levofloxacin 750 mg IV once daily) (AI)  
*Preferred Beta-Lactams:*  
- Piperacillin-tazobactam, cefepime, imipenem, or meropenem  
Empiric Therapy for Patients at Risk for Methicillin-Resistant *Staphylococcus aureus* Pneumonia:  
- Add vancomycin IV or linezolid (IV or PO) to the baseline regimen (AII)  
- Addition of clindamycin to vancomycin (but *not* to linezolid) can be considered for severe necrotizing pneumonia to minimize bacterial toxin production (CII). | | |
| Cryptococcosis | Cryptococcal Meningitis  
*Induction Therapy* (for at least 2 weeks, followed by consolidation therapy):  
- Liposomal amphotericin B 3–4 mg/kg IV daily + flucytosine 25 mg/kg PO QID (AI) (Note: Flucytosine dose should be adjusted in patients with renal dysfunction.)  
*Consolidation Therapy* (for at least 8 weeks (AI), followed by maintenance therapy):  
- Fluconazole 400 mg PO (or IV) daily (AII)  
*Maintenance Therapy:*  
- Fluconazole 200 mg PO daily for at least 12 months (AI)  
For Non-CNS, Extrapulmonary Cryptococcosis and Diffuse Pulmonary Disease:  
- Treatment same as for cryptococcal meningitis (BIII)  
Non-CNS Cryptococcosis with Mild-to-Moderate Symptoms and Focal Pulmonary Infiltrates:  
- Fluconazole, 400 mg PO daily for 12 months (BIII) | Cryptococcal meningitis  
*Induction Therapy* (for at least 2 weeks, followed by consolidation therapy):  
- Amphotericin B deoxycholate 0.7 mg/kg IV daily + flucytosine 25 mg/kg PO QID (AI), or  
- Amphotericin B lipid complex 5 mg/kg IV daily + flucytosine 25 mg/kg PO QID (BII), or  
- Liposomal amphotericin B 3-4 mg/kg IV daily + fluconazole 800 mg PO or IV daily (BIII), or  
- Amphotericin B deoxycholate 0.7 mg/kg IV daily + fluconazole 800 mg PO or IV daily (BII), or  
- Fluconazole 400–800 mg PO or IV daily + flucytosine 25 mg/kg PO QID (BII), or  
- Fluconazole 1200 mg PO or IV daily (CII)  
*Consolidation Therapy* (for at least 8 weeks (AI), followed by maintenance therapy):  
- Itraconazole 200 mg PO BID for 8 weeks—less effective than fluconazole (CI)  
*Maintenance Therapy:*  
- No alternative therapy recommendation | Addition of flucytosine to amphotericin B has been associated with more rapid sterilization of CSF and decreased risk for subsequent relapse.  
Patients receiving flucytosine should have either blood levels monitored (peak level 2 hours after dose should be 30–80 mcg/mL) or close monitoring of blood counts for development of cytopenia. Dosage should be adjusted in patients with renal insufficiency (BII).  
Opening pressure should always be measured when an LP is performed (AII). Repeated LPs or CSF shunting are essential to effectively manage increased intracranial pressure (BII). Corticosteroids and mannitol are ineffective in reducing ICP and are NOT recommended (BII). Corticosteroid should not be routinely used during induction therapy unless it is used for management of IRIS (AI). |
### Table 2. Treatment of AIDS-Associated Opportunistic Infections (Includes Recommendations for Acute Treatment and Secondary Prophylaxis/Chronic Suppressive/Maintenance Therapy)

<table>
<thead>
<tr>
<th>Opportunistic Infection</th>
<th>Preferred Therapy</th>
<th>Alternative Therapy</th>
<th>Other Comments</th>
</tr>
</thead>
</table>
| Cryptosporidiosis        | • Initiate or optimize ART for immune restoration to CD4 count >100 cells/µL (AII), and  
  • Aggressive oral or IV rehydration and replacement of electrolyte loss (AII), and  
  • Symptomatic treatment of diarrhea with anti-motility agents (AII). | No therapy has been shown to be effective without ART. Trial of these agents may be used in conjunction with, but not instead of, ART:  
  • Nitazoxanide 500–1000 mg PO BID for 14 days (CIII), or  
  • Paromomycin 500 mg PO QID for 14–21 days (CIII)  
  • With optimized ART, symptomatic treatment and rehydration and electrolyte replacement | Tincture of opium may be more effective than loperamide in management of diarrhea (CII). |
| Cystoisosporiasis (Formerly Isosporiasis) | **For Acute Infection:**  
  • TMP-SMX (160 mg/800 mg) PO (or IV) QID for 10 days (AII), or  
  • TMP-SMX (160 mg/800 mg) PO (or IV) BID for 7–10 days (BI)  
  • Can start with BID dosing first and increase daily dose and/or duration (up to 3–4 weeks) if symptoms worsen or persist (BII)  
  • IV therapy may be used for patients with potential or documented malabsorption.  
**Chronic Maintenance Therapy (Secondary Prophylaxis):**  
• In patients with CD4 count <200/µL, TMP-SMX (160 mg/800 mg) PO TIW (AI) | **For Acute Infection:**  
  • Pyrimethamine 50–75 mg PO daily + leucovorin 10–25 mg PO daily (BII), or  
  • Ciprofloxacin 500 mg PO QID for 7 days (CI) as a second line alternative  
**Chronic Maintenance Therapy (Secondary Prophylaxis):**  
• TMP-SMX (160 mg/800 mg) PO daily or (320 mg/1600 mg) three times weekly (BII)  
• Pyrimethamine 25 mg PO daily + leucovorin 5–10 mg PO daily (BII)  
• Ciprofloxacin 500 mg three times weekly (CI) as a second-line alternative | Fluid and electrolyte management in patients with dehydration (AIII).  
Nutritional supplementation for malnourished patients (AII).  
Immune reconstitution with ART may result in fewer relapses (AII). |
| Cytomegalovirus (CMV) Disease | **CMV Retinitis Induction Therapy (followed by Chronic Maintenance Therapy):**  
  **For Immediate Sight-Threatening Lesions (within 1500 microns of the fovea):**  
  • Intravitreal injections of ganciclovir (2 mg) or foscarnet (2.4 mg) for 1–4 doses over a period of 7–10 days to achieve high intracellular concentration faster (AIII); plus  
  • Valganciclovir 900 mg PO BID for 14–21 days, then 900mg once daily (AI):  
**For Peripheral Lesions:**  
• Valganciclovir 900 mg PO BID for 14–21 days, then 900 mg once daily (AI)  
**Chronic Maintenance:**  
• Valganciclovir 900 mg PO daily (AI) for 3-6 months until ART induced immune recovery (see Table 4) | **CMV Retinitis**  
**For Immediate Sight-Threatening Lesions (within 1500 microns of the fovea): Intravitreal therapy as listed in the Preferred section, plus one of the following:**  
• Ganciclovir 5 mg/kg IV q12h for 14–21 days (AII), or  
• Foscarnet 90 mg/kg IV q12h or 60 mg/kg q8h for 14–21 days (AI), or  
• Cidofovir 5 mg/kg/week IV for 2 weeks; saline hydration before and after therapy and probenecid, 2 g PO 3 hours before dose, followed by 1 g PO 2 hours and 8 hours after the dose (total of 4 g) (BII). (Note: This regimen should be avoided in patients with sulfa allergy because of cross hypersensitivity with probenecid.)  
**Alternative Systemic Induction Therapy (followed by Chronic Maintenance Therapy):**  
• Ganciclovir 5 mg/kg IV q12h for 14–21 days (AII), or  
• Foscarnet 90 mg/kg IV q12h or 60 mg/kg q8h for 14–21 days (AI), or  
• Cidofovir 5 mg/kg/week IV for 2 weeks; saline hydration before and after therapy and probenecid, 2 g PO 3 hours before dose, followed by 1 g PO 2 hours and 8 hours after the dose (total of 4 g) (BII). (Note: This regimen should be avoided in patients with sulfa allergy because of cross hypersensitivity with probenecid.)  
**The choice of therapy for CMV retinitis should be individualized, based on location and severity of the lesions, level of immunosuppression, and other factors (e.g., concomitant medications and ability to adhere to treatment) (AII).**  
Given the evident benefits of systemic therapy in preventing contralateral eye involvement, reduce CMV visceral disease and improve survival. Whenever feasible, treatment should include systemic therapy.  
The ganciclovir ocular implant, which is effective for treatment of CMV retinitis is no longer available. For sight threatening retinitis, intravitreal injections of ganciclovir or foscarnet can be given to achieve higher ocular concentration faster. |
Table 2. Treatment of AIDS-Associated Opportunistic Infections (Includes Recommendations for Acute Treatment and Secondary Prophylaxis/Chronic Suppressive/Maintenance Therapy) (page 9 of 23)

</thead>
</table>
| **Cytomegalovirus (CMV) Disease**, continued | **CMV Esophagitis or Colitis:**  
• Ganciclovir 5 mg/kg IV q12h; may switch to valganciclovir 900 mg PO q12h once the patient can tolerate oral therapy *(BI)*  
• Duration: 21–42 days or until symptoms have resolved *(CII)*  
• Maintenance therapy is usually not necessary, but should be considered after relapses *(BII)*. | **Chronic Maintenance (for 3-6 months until ART induced immune recovery (see Table 4):**  
• Ganciclovir 5 mg/kg IV 5–7 times weekly *(AI)*, or  
• Foscarnet 90–120 mg/kg IV once daily *(AI)*, or  
• Cidofovir 5 mg/kg IV every other week with saline hydration and probenecid as above *(BI)* | Routine (i.e., every 3 months) ophthalmologic follow-up is recommended after stopping chronic maintenance therapy for early detection of relapse or IRU, and then periodically after sustained immune reconstitution *(AIII)*. IRU may develop in the setting of immune reconstitution. **Treatment of IRU**  
• Periocular corticosteroid or short courses of systemic steroid *(BIII)*. Initial therapy in patients with CMV retinitis, esophagitis, colitis, and pneumonitis should include initiation or optimization of ART *(BIII)*. |
| **Well-Documented, Histologically Confirmed CMV Pneumonia:**  
• Experience for treating CMV pneumonitis in HIV patients is limited. Use of IV ganciclovir or IV foscarnet is reasonable (doses same as for CMV retinitis) *(CIII)*.  
• The optimal duration of therapy and the role of oral valganciclovir have not been established. | **CMV Esophagitis or Colitis:**  
• Foscarnet 90 mg/kg IV q12h or 60 mg/kg IV q8h *(BI)* for patients with treatment-limiting toxicities to ganciclovir or with ganciclovir resistance, or  
• Valganciclovir 900 mg PO q12h in milder disease and if able to tolerate PO therapy *(BII)*, or  
• Duration: 21–42 days or until symptoms have resolved *(CII)*  
• For mild disease, if ART can be initiated without delay, consider withholding CMV therapy *(CIII)*. | **Note:** Treatment should be initiated promptly.  
• Ganciclovir 5 mg/kg IV q12h + (foscarnet 90 mg/kg IV q12h or 60 mg/kg IV q8h) to stabilize disease and maximize response, continue until symptomatic improvement and resolution of neurologic symptoms *(CIII)*  
• The optimal duration of therapy and the role of oral valganclovir have not been established.  
• Optimize ART to achieve viral suppression and immune reconstitution *(BIII)*. | **Note:** Treatment should be initiated promptly.  
• Ganciclovir 5 mg/kg IV q12h; may switch to valganciclovir 900 mg PO q12h once the patient can tolerate oral therapy *(BI)*  
• Duration: 21–42 days or until symptoms have resolved *(CII)*  
• Maintenance therapy is usually not necessary, but should be considered after relapses *(BII)*. |

<tbody>
<tr>
<td><strong>Hepatitis B Virus (HBV) Disease</strong></td>
<td>ART is recommended for all HIV/ HBV-co-infected patients regardless of CD4 cell count (AII). ART regimen should include 2 drugs that are active against both HBV and HIV, with [(tenofovir DF 300 mg or tenofovir alafenamide* 10 or 25mg) + (emtricitabine 200 mg or lamivudine 300 mg)] PO once daily (+ additional drug(s) for HIV) (AIII). Please refer to Table 7 for dosing recommendations in patients with renal impairment. <strong>Duration:</strong> Continue treatment indefinitely (CIII) * Tenofovir alafenamide (TAF) 10 mg dose is in the fixed dose combination tablets of elvitegravir/ cobicistat/TAF/emtricitabine and darunavir/cobicistat/TAF/ emtricitabine; when TAF is used with other ARVs, the dose is 25 mg.</td>
<td>For Patients Who Refuse or Are Unable to Take ART or Who Are HIV Long-Term Non-Progressors: HBV treatment is indicated for all those who meet criteria for treatment according to the AASLD 2018 guidelines. • Peginterferon alfa-2a 180 µg SQ once weekly for 48 weeks (CIII), or • Peginterferon alfa 2b 1.5 µg/kg SQ once weekly for 48 weeks (CIII)</td>
<td>Directly acting HBV drugs such as adefovir, emtricitabine, entecavir, lamivudine, telbivudine, or tenofovir must not be given in the absence of a fully suppressive ART regimen to avoid selection of drug resistance HIV (AII). Cross-resistance to emtricitabine or telbivudine should be assumed in patients with suspected or proven lamivudine-resistance. When changing ART regimens, continue agents with anti-HBV activity (BIII). If anti-HBV therapy is discontinued and a flare occurs, therapy should be re-instituted because it can be potentially life-saving (AIII). As HBV reactivation can occur during treatment for HCV with directly active agents (DAAs) in the absence of HBV-active drugs, all patients with HIV/ HBV coinfection who will be treated for HCV should be on HBV-active ART at the time of HCV treatment initiation (AIII).</td>
</tr>
<tr>
<td><strong>Hepatitis C Virus (HCV) Disease</strong></td>
<td>The field of HCV drug development is evolving rapidly. The armamentarium of approved drugs is likely to expand considerably in the next few years. Clinicians should refer to the most recent HCV treatment guidelines (<a href="http://www.hcvguidelines.org">http://www.hcvguidelines.org</a>) for the most updated recommendations.</td>
<td></td>
<td></td>
</tr>

<th>Opportunistic Infection</th>
<th>Preferred Therapy</th>
<th>Alternative Therapy</th>
<th>Other Comments</th>
</tr>
</thead>
</table>
| **Herpes Simplex Virus (HSV) Disease**   | Orolabial Lesions (For 5–10 Days): • Valacyclovir 1 g PO BID (AIII), or • Famciclovir 500 mg PO BID (AIII), or • Acyclovir 400 mg PO TID (AIII) | For Acyclovir-Resistant HSV  
**Preferred Therapy:** • Foscarnet 80–120 mg/kg/day IV in 2–3 divided doses until clinical response (AII)  
**Alternative Therapy (CIII):** • IV cidofovir (dosage as in CMV retinitis), or • Topical trifluridine, or • Topical cidofovir, or • Topical imiquimod  
**Duration of Therapy:** • 21–28 days or longer | Patients with HSV infections can be treated with episodic therapy when symptomatic lesions occur, or with daily suppressive therapy to prevent recurrences.  
Topical formulations of trifluridine and cidofovir are not commercially available.  
Extemporaneous compounding of topical products can be prepared using trifluridine ophthalmic solution and the IV formulation of cidofovir. |
|                                          | Initial or Recurrent Genital HSV (For 5–14 Days): • Valacyclovir 1 g PO BID (AII), or • Famciclovir 500 mg PO BID (AII), or • Acyclovir 400 mg PO TID (AII)  
Severe Mucocutaneous HSV: • Initial therapy acyclovir 5 mg/kg IV q8h (AIII)  
• After lesions begin to regress, change to PO therapy as above. Continue until lesions are completely healed.  
**Chronic Suppressive Therapy**  
For patients with severe recurrences of genital herpes (AII) or patients who want to minimize frequency of recurrences (AII): • Valacyclovir 500 mg PO BID (AII) • Famciclovir 500 mg PO BID (AII) • Acyclovir 400 mg PO BID (AII)  
• Continue indefinitely regardless of CD4 cell count. | | |

</tbody>
</table>
| Leishmaniasis Visceral  | For Initial Infection:  
• Liposomal amphotericin B 2–4 mg/kg IV daily (AII), or  
• Liposomal amphotericin B interrupted schedule (e.g., 4 mg/kg on days 1–5, 10, 17, 24, 31, 38) (AII)  
• To achieve total dose of 20–60 mg/kg (AII)  
Chronic Maintenance Therapy (Secondary Prophylaxis): Especially in Patients with CD4 Count <200 cells/µL:  
• Liposomal amphotericin B 4 mg/kg every 2–4 weeks (AII), or  
• Amphotericin B lipid complex (AII) 3 mg/kg every 21 days (AII) | For Initial Infection:  
• Other lipid formulation of amphotericin B, dose and schedule as in Preferred Therapy, or  
• Amphotericin B deoxycholate 0.5–1.0 mg/kg IV daily for total dose of 1.5–2.0 g (BII), or  
• Sodium stibogluconate (pentavalent antimony) (BII) 20 mg/kg IV or IM daily for 28 days.  
Another Option:  
• Miltefosine 100 mg PO daily for 4 weeks (available in the United States under a treatment IND) (CIII)  
Chronic Maintenance Therapy (Secondary Prophylaxis):  
• Sodium stibogluconate 20 mg/kg IV or IM every 4 weeks (BII) | ART should be initiated or optimized (AIII).  
For sodium stibogluconate, contact the CDC Drug Service at (404) 639-3670 or drugservice@cdc.gov. |
| Cutaneous               | • Liposomal amphotericin B 2–4 mg/kg IV daily for 10 days (BIII), or  
• Liposomal amphotericin B interrupted schedule (e.g., 4 mg/kg on days 1–5, 10, 17, 24, 31, 38) to achieve total dose of 20–60 mg/kg (BIII), or  
• Sodium stibogluconate 20 mg/kg IV or IM daily for 3–4 weeks (BIII)  
Chronic Maintenance Therapy:  
May be indicated in immunocompromised patients with multiple relapses (CIII) | Possible Options Include:  
• Oral miltefosine (can be obtained via a treatment IND), or  
• Topical paromomycin, or  
• Intrallesional sodium stibogluconate, or  
• Local heat therapy  
No data exist for any of these agents in HIV-infected patients; choice and efficacy dependent on species of Leishmania. | None. |
| Malaria                 | Because *Plasmodium falciparum* malaria can progress within hours from mild symptoms or low-grade fever to severe disease or death, all HIV-infected patients with confirmed or suspected *P. falciparum* infection should be hospitalized for evaluation, initiation of treatment, and observation (AIII).  
Treatment recommendations for HIV-infected patients are the same as HIV-uninfected patients (AIII). | When suspicion for malaria is low, antimalarial treatment should not be initiated until the diagnosis is confirmed.  
For treatment recommendations for specific regions, clinicians should refer to the following web link: http://www.cdc.gov/malaria/ or call the CDC Malaria Hotline: (770) 488-7788. M–F 8 AM–4:30 PM ET, or (770) 488-7100 after hours | None. |

</table>
| **Microsporidiosis**    | For GI Infections Caused by *Enterocytozoon bieneusi*:  
  - Initiate or optimize ART with immune restoration to CD4 count >100 cells/mm³ (*AII*); plus  
  - Manage severe dehydration, malnutrition, and wasting by fluid support (*AII*) and nutritional supplement (*AIII*)  
For Intestinal and Disseminated (Not Ocular) Infections Caused by Microsporidia Other Than *E. bieneusi* and *Vittaforma corneae*:  
  - Albendazole 400 mg PO twice daily (*AII*), continue until CD4 count >200 cells/mm³ for >6 months after initiation of ART (*BIII*)  
For Disseminated Disease Caused by *Trachipleistophora* or *Annecilia*:  
  - Itraconazole 400 mg PO daily plus albendazole 400 mg PO twice daily (*CIII*)  
For Ocular Infection:  
  - Topical fumagillin bicyclohexylammonium (Fumidil B) eye drops 3 mg/mL in saline (fumagillin 70 µg/mL): two drops every 2 hours for 4 days, then two drops four times daily (investigational use only in United States) (*BII*) plus albendazole 400 mg PO twice daily, for management of systemic infection (*BIII*)  
If CD4 count >200 cells/mm³:  
  - Continue until symptoms resolved (*CIII*).  
If CD4 count ≤200 cells/mm³:  
  - Continue until resolution of ocular symptoms and CD4 count increases to >200 cells/mm³ for >6 months in response to ART (*BIII*). | | Anti-motility agents can be used for diarrhea control if required (*BIII*).  
Fumagillin is available in France as FLISINT® 20 mg capsules. Only available as compassionate use; see the [Sanofi Compassionate Use/Managed Access Program](https://www.sanofi-usa.com). |

| **Mycobacterium avium**<br>Complex (MAC) Disease | At Least 2 Drugs as Initial Therapy to Prevent or Delay Emergence of Resistance:  
• Clarithromycin 500 mg PO BID (AI) + ethambutol 15 mg/kg PO daily (AI), or  
• If drug interaction or intolerance precludes the use of clarithromycin, (azithromycin 500–600 mg + ethambutol 15 mg/kg) PO daily (AII) | Some experts recommend addition of a third or fourth drug for patients with high mycobacterial loads (>2 log CFU/mL of blood), or in the absence of effective ART (CIII).  
Third or Fourth Drug Options May Include:  
• Rifabutin 300 mg PO daily (dose adjustment may be necessary based on drug interactions) (CI), or  
• A fluoroquinolone such as moxifloxacin 400 mg PO daily (CIII) or levofloxacin 500 mg PO daily (CIII), or  
• An injectable aminoglycoside such as amikacin 10–15 mg/kg IV daily (CIII) or streptomycin 1 g IV or IM daily (CIII) | Testing of susceptibility to clarithromycin and azithromycin is recommended (BIII).  
NSAIDs can be used for moderate to severe symptoms attributed to IRIS (CIII).  
If IRIS symptoms persist, short course (i.e., 4 weeks–8 weeks) systemic corticosteroid (equivalent to 20–40 mg prednisone) can be used (CII). |
| **Mycobacterium tuberculosis** (TB) Disease | After collecting specimen for culture and molecular diagnostic tests, empiric TB treatment should be started in individuals with clinical and radiographic presentation suggestive of TB (AIII).  
Refer to Table 3 for dosing recommendations.  
Initial Phase (2 Months, Given Daily by DOT) (AI):  
• INH (plus pyridoxine) plus (RIF or RFB) plus PZA plus EMB (AI).  
Continuation Phase (Duration Depends on Site and Severity of Infection [as noted below]):  
• INH (plus pyridoxine) plus (RIF or RFB) daily (AI)  
Total Duration of Therapy (For Drug-Susceptible TB):  
Pulmonary, Drug-Susceptible TB:  
• 6 months (BII)  
Pulmonary TB with Positive Culture After 2 Months of TB Treatment, or Severe Cavitary or Disseminated Extrapulmonary TB:  
• 9 months (BII)  
Extra-Pulmonary TB with CNS Infection:  
• 9–12 months (BII) | If rapid drug susceptibility testing (DST) indicates resistance to rifampin with or without other drugs:  
• INH (plus pyridoxine) plus EMB plus PZA plus (moxifloxacin or levofloxacin) plus an aminoglycoside, or  
• Capreomycin (BIII); adjust regimen as conventional DST become available  
**Treatment for Drug Resistant TB**  
**Resistant to INH:**  
• (Moxifloxacin or levofloxacin) plus (RIF or RFB) plus EMB plus PZA plus for 6 months (BII);  
**Resistant to Rifamycins Plus or Minus Other Drugs:**  
• Therapy should Include at least 5 active drugs, individualized based on DST results, clinical and microbiological responses, and with close consultation with experienced specialists (AIII). | DOT is recommended for all patients (AII)  
All patients with HIV and TB should be started on ART. Refer to text for recommendations on when to start ART while on TB treatment.  
All rifamycins may have significant pharmacokinetic interactions with ARV drugs, please refer to the Drug-Drug Interactions section in the Adult and Adolescent Antiretroviral Guidelines for dosing recommendations.  
Therapeutic drug monitoring should be considered in patients receiving rifampicin and interacting ART.  
Adjunctive corticosteroids improve survival for TB with CNS involvement (AI). See text for drug, dose, and duration recommendations.  
Paradoxical IRIS that is not severe can be treated with NSAIDs without a change in TB or HIV therapy (BIII).  
See text for prednisone dosing recommendations for pre-emptive treatment or management of IRIS. |
### Table 2. Treatment of AIDS-Associated Opportunistic Infections (Includes Recommendations for Acute Treatment and Secondary Prophylaxis/Chronic Suppressive/Maintenance Therapy)  

<table>
<thead>
<tr>
<th>Opportunistic Infection</th>
<th>Preferred Therapy</th>
<th>Alternative Therapy</th>
<th>Other Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Mycobacterium tuberculosis (TB) Disease, continued</strong></td>
<td><strong>Extra-Pulmonary TB in Other Sites:</strong>&lt;br&gt;• 6 months (BII)</td>
<td>For Moderate-to-Severe PCP:&lt;br&gt;• Pentamidine 4 mg/kg IV daily infused over ≥60 minutes (AI); can reduce dose to 3 mg/kg IV daily in the event of toxicities (BI), or&lt;br&gt;• Primaquine 30 mg (base) PO daily plus (clindamycin 600 mg IV every 6 hours or 900 mg IV every 8 hours) or (clindamycin 450 mg PO every 6 hours or 600 mg PO every 8 hours) (AI)</td>
<td>Indications for Adjunctive Corticosteroids (AI):&lt;br&gt;• PaO₂ &lt;70 mmHg at room air, or&lt;br&gt;• Alveolar-arterial DO₂ gradient &gt;35 mmHg&lt;br&gt;Prednisone Doses (Beginning as Early as Possible and Within 72 Hours of PCP Therapy) (AI):&lt;br&gt;• Days 1–5: 40 mg PO twice daily&lt;br&gt;• Days 6–10: 40 mg PO daily&lt;br&gt;• Days 11–21: 20 mg PO daily&lt;br&gt;IV methylprednisolone can be administered as 75% of prednisone dose. Benefit of corticosteroid if started after 72 hours of treatment is unknown, but some clinicians will use it for moderate-to-severe PCP (BIII). Whenever possible, patients should be tested for G6PD before use of dapsone or primaquine. Alternative therapy should be used in patients found to have G6PD deficiency. Patients who are receiving pyrimethamine/sulfadiazine for treatment or suppression of toxoplasmosis do not require additional PCP prophylaxis (AI). If TMP-SMX is discontinued because of a mild adverse reaction, re-institution should be considered after the reaction resolves (AI). The dose can be increased gradually (desensitization) (BI), reduced, or the frequency modified (CIII). TMP-SMX should be permanently discontinued in patients with possible or definite Stevens-Johnson Syndrome or toxic epidermal necrosis (AI).</td>
</tr>
<tr>
<td><strong>Pneumocystis Pneumonia (PCP)</strong></td>
<td>Patients who develop PCP despite TMP-SMX prophylaxis can usually be treated with standard doses of TMP-SMX (BIII). Duration of PCP treatment: 21 days (AII) For Moderate to Severe PCP:&lt;br&gt;• TMP-SMX: (TMP 15–20 mg and SMX 75–100 mg)/kg/day IV given every 6 hours or every 8 hours (AI); may switch to PO formulations after clinical improvement (AI). For Mild to Moderate PCP:&lt;br&gt;• TMP-SMX: (TMP 15–20 mg and SMX 75–100 mg)/kg/day, given PO in 3 divided doses (AI), or&lt;br&gt;• TMP-SMX: (160 mg/800 mg or DS) two tablets PO three times daily (AI) Secondary Prophylaxis, After Completion of PCP Treatment:&lt;br&gt;• TMP-SMX DS: 1 tablet PO daily (AI), or&lt;br&gt;• TMP-SMX (80 mg/400 mg or SS): 1 tablet PO daily (AI)</td>
<td>For Moderate-to-Severe PCP:&lt;br&gt;• TMP-SMX DS: 1 tablet PO three times weekly (BI), or&lt;br&gt;• Dapsone 100 mg PO daily (BI), or&lt;br&gt;• Dapsone 50 mg PO daily with (pyrimethamine² 50 mg plus leucovorin 25 mg) PO weekly (BI), or&lt;br&gt;• (Dapsone 200 mg plus pyrimethamine² 75 mg plus leucovorin 25 mg) PO weekly (BI), or&lt;br&gt;• Aerosolized pentamidine 300 mg monthly via Respirgard II™ nebulizer (BI), or&lt;br&gt;• Atovaquone 1500 mg PO daily (BI), or&lt;br&gt;• (Atovaquone 1500 mg plus pyrimethamine² 25 mg plus leucovorin 10 mg) PO daily (CIII)</td>
<td></td>

</table>
| Syphilis                                                   | Early Stage (Primary, Secondary, and Early-Latent Syphilis):  
  • Benzathine penicillin G 2.4 million units IM for 1 dose (AII)  
  Late-Latent Disease (>1 year or of Unknown Duration, and No Signs of Neurosyphilis):  
  • Benzathine penicillin G 2.4 million units IM weekly for 3 doses (AII)  
  Late-Stage (Tertiary—Cardiovascular or Gummatous Disease):  
  • Benzathine penicillin G 2.4 million units IM weekly for 3 doses (AII)  
  (Note: rule out neurosyphilis before initiation of benzathine penicillin, and obtain infectious diseases consultation to guide management)  
  Neurosyphilis (Including Otic or Ocular Disease):  
  • Aqueous crystalline penicillin G 18–24 million units per day (administered as 3–4 million units IV q4h or by continuous IV infusion) for 10–14 days (AII) +/- benzathine penicillin G 2.4 million units IM weekly for 3 doses after completion of IV therapy (CIII) | Early Stage (Primary, Secondary, and Early-Latent Syphilis):  
  For penicillin-allergic patients  
  • Doxycycline 100 mg PO BID for 14 days (BII), or  
  • Ceftriaxone 1 g IM or IV daily for 10–14 days (BII), or  
  • Azithromycin 2 g PO for 1 dose (BII) (Note: azithromycin is not recommended for men who have sex with men or pregnant women (AII))  
  Late-Latent Disease (>1 year or of Unknown Duration, and No Signs of Neurosyphilis):  
  For penicillin-allergic patients  
  • Doxycycline 100 mg PO BID for 28 days (BIII)  
  Neurosyphilis:  
  • Procaine penicillin 2.4 million units IM daily plus probenecid 500 mg PO QID for 10–14 days (BII) +/- benzathine penicillin G 2.4 million units IM weekly for 3 doses after completion of above (CIII), or  
  • For penicillin-allergic patients: Desensitization to penicillin is the preferred approach (BIII); if not feasible, ceftriaxone, 2 g IV daily for 10–14 days (BII) | The efficacy of non-penicillin alternatives has not been evaluated in HIV-infected patients and they should be used only with close clinical and serologic monitoring.  
Combination of procaine penicillin and probenecid is not recommended for patients who are allergic to sulfas-containing medications (AIII).  
The Jarisch-Herxheimer reaction is an acute febrile reaction accompanied by headache and myalgia that can occur within the first 24 hours after therapy for syphilis. This reaction occurs most frequently in patients with early syphilis, high nontreponemal titers, and prior penicillin treatment. |

</table>
| Talaromycosis (Penicilliosis) | **Induction Therapy:**  
- Liposomal amphotericin B 3–5 mg/kg/day IV (AI)  
**Duration:**  
- 2 weeks (AI), followed by consolidation therapy  
**Consolidation Therapy:**  
- Itraconazole 200 mg PO twice daily for 10 weeks (AI), followed by chronic maintenance therapy  
**Chronic Maintenance Therapy:**  
- Itraconazole 200 mg PO once daily, until CD4 count >100 cells/mm³ for ≥6 months (AII) | **Induction Therapy:**  
- Amphotericin B deoxycholate 0.7 mg/kg/day IV for 2 weeks (if liposomal amphotericin B is not available) (AI)  
*If Amphotericin B is Not Available:*  
- Voriconazole 6 mg/kg IV every 12 hours for 1 day (loading dose), then 4 mg/kg IV every 12 hours (BII), or  
- Voriconazole 600 mg PO twice daily for 1 day (loading dose), then 400 mg PO twice daily (BII)  
**Duration:**  
- 2 weeks (BII) followed by consolidation therapy with itraconazole (preferred) or voriconazole  
**Consolidation Therapy:**  
- Voriconazole 200 mg PO twice daily for 10 weeks (BII), followed by chronic maintenance therapy  
**Chronic Maintenance Therapy:**  
- Itraconazole should be used (AII). Chronic maintenance therapy with voriconazole has not been studied. | Itraconazole is not recommended as induction therapy for talaromycosis (AI).  
ART can be initiated as early as 1 week after initiation of treatment for talaromycosis (BIII).  
Itraconazole and voriconazole may have significant interactions with certain ARV agents. These interactions are complex and can be bi-directional. Refer to Drug-Drug Interactions in the Adult and Adolescent Antiretroviral Guidelines for dosage recommendations.  
TDM and dosage adjustment may be necessary to ensure triazole antifungal and ARV efficacy and reduce concentration-related toxicities. The goals of itraconazole and voriconazole trough concentrations are >0.5 mcg/mL and >1.0 mcg/mL respectively. |

</table>
| **Toxoplasma gondii Encephalitis** | **Treatment of Acute Infection (AI):**  
- Pyrimethamine^a 200 mg PO 1 time, followed by weight-based therapy:  
  - If <60 kg, pyrimethamine^a 50 mg PO once daily + sulfadiazine 1000 mg PO q6h + leucovorin 10–25 mg PO once daily  
  - If ≥60 kg, pyrimethamine^a 75 mg PO once daily + sulfadiazine 1500 mg PO q6h + leucovorin 10–25 mg PO once daily  
  - Leucovorin dose can be increased to 50 mg daily or BID.  
**Duration for Acute Therapy:**  
- At least 6 weeks (BII); longer duration if clinical or radiologic disease is extensive or response is incomplete at 6 weeks  
- After completion of acute therapy, all patients should be initiated on chronic maintenance therapy  
**Chronic Maintenance Therapy:**  
- Pyrimethamine^a 25–50 mg PO daily + sulfadiazine 2000–4000 mg PO daily (in 2–4 divided doses) + leucovorin 10–25 mg PO daily (AI)  
**Treatment of Acute Infection:**  
- Pyrimethamine^a (leucovorin)* + clindamycin 600 mg IV or PO q6h (AI), or  
- TMP-SMX (TMP 5 mg/kg and SMX 25 mg/kg) IV or PO BID (BII), or  
- Atovaquone 1500 mg PO BID with food + pyrimethamine^a (leucovorin)* (BII), or  
- Atovaquone 1500 mg PO BID with food + sulfadiazine 1000–1500 mg PO q6h (weight-based dosing, as in preferred therapy) (BII), or  
- Atovaquone 1500 mg PO BID with food (BII)  
**Chronic Maintenance Therapy:**  
- Clindamycin 600 mg PO q8h + (pyrimethamine^a 25–50 mg + leucovorin 10–25 mg) PO daily (BII), or  
- TMP-SMX DS 1 tablet BID (BII), or  
- TMP-SMX DS 1 tablet once daily (BII); or  
- Atovaquone 750–1500 mg PO BID + (pyrimethamine^a 25 mg + leucovorin 10 mg) PO daily (BII), or  
- Atovaquone 750–1500 mg PO BID with food (BII)  
- * Pyrimethamine^a and leucovorin doses are the same as for preferred therapy. |  
**If pyrimethamine is unavailable or there is a delay in obtaining it, TMP-SMX should be utilized in place of pyrimethamine-sulfadiazine (BII).**  
**For patients with a history of sulfa allergy, sulfa desensitization should be attempted using one of several published strategies (BII).**  
**Atovaquone should be administered until therapeutic doses of TMP-SMX are achieved (CIII).**  
**Adjunctive corticosteroids (e.g., dexamethasone) should only be administered when clinically indicated to treat mass effect associated with focal lesions or associated edema (BII); discontinue as soon as clinically feasible.**  
**Anticonvulsants should be administered to patients with a history of seizures (AIII) and continued through acute treatment, but should not be used as seizure prophylaxis (AIII).**  
**If clindamycin is used in place of sulfadiazine, additional therapy must be added to prevent PCP (AII).** |

</table>
| Varicella-Zoster Virus (VZV) Disease | **Primary Varicella Infection (Chickenpox)**  
- *Uncomplicated Cases:*  
  • Initiate as soon as possible after symptom onset and continue for 5 to 7 days:  
  • Valacyclovir 1 g PO three times a day (*AII*), or  
  • Famciclovir 500 mg PO three times a day (*AII*)  
- *Severe or Complicated Cases:*  
  • Acyclovir 10 mg/kg IV every 8 hours for 7–10 days (*AIII*)  
  • May switch to oral valacyclovir, famciclovir, or acyclovir after defervescence if no evidence of visceral involvement (*BIII*).  
| **Herpes Zoster (Shingles)**  
- *Acute Localized Dermatomal:*  
  • For 7–10 days, consider longer duration if lesions are slow to resolve  
  • Valacyclovir 1 g PO three times a day (*AII*), or  
  • Famciclovir 500 mg three times a day (*AII*)  
| **Extensive Cutaneous Lesion or Visceral Involvement:**  
  • Acyclovir 10 mg/kg IV every 8 hours until clinical improvement is evident (*AII*)  
  • May switch to PO therapy (valacyclovir, famciclovir, or acyclovir) after clinical improvement (i.e., when no new vesicle formation or improvement of signs and symptoms of visceral VZV), to complete a 10–14-day course (*BIII*).  
| **ARN:**  
  • Acyclovir 10 mg/kg IV every 8 hours for 10–14 days, followed by valacyclovir 1 g PO three times a day for >14 weeks (*AII*), plus  
  • Intravitreal ganciclovir 2 mg/0.05 mL twice weekly for 1-2 doses (*BIII*).  
| **PORN:**  
  • Acyclovir 10 mg/kg IV every 8 hours or ganciclovir 5 mg/kg IV every 12 hours (*AIII*), plus  
| Primary Varicella Infection (Chickenpox)  
- *Uncomplicated Cases (For 5–7 Days):*  
  • Acyclovir 800 mg PO 5 times a day (*BII*)  
| **Herpes Zoster (Shingles)**  
- *Acute Localized Dermatomal:*  
  • For 7–10 days; consider longer duration if lesions are slow to resolve  
  • Acyclovir 800 mg PO 5 times a day (*BII*)  
| In managing VZV of the eyes, consultation with an ophthalmologist experienced in management of VZV retinitis is strongly recommended (*AIII*).  
| Duration of therapy for VZV retinitis is not well defined, and should be determined based on clinical, virologic, and immunologic responses and ophthalmologic responses.  
Optimization of ART is recommended for serious and difficult-to-treat VZV infections (e.g., retinitis, encephalitis) (*AIII*).  
| In patients with herpes zoster ophthalmicus who have stromal keratitis and anterior uveitis, topical corticosteroids to reduce inflammation may be necessary. The role of ART has not been established in these cases.  |

**Key to Acronyms:** ACTG = AIDS Clinical Trials Group; ARN = acute retinal necrosis; ART = antiretroviral therapy; ARV = antiretroviral; ATV/r = ritonavir-boosted atazanavir; BID = twice a day; BIW = twice weekly; BOC = boceprevir; CD4 = CD4 T lymphocyte cell; CDC = The Centers for Disease Control and Prevention; CFU = colony-forming unit; CNS = central nervous system; CSF = cerebrospinal fluid; CYP3A4 = Cytochrome P450 3A4; ddI = didanosine; DOT = directly-observed therapy; DS = double strength; EFV = efavirenz; EMB = ethambutol; g = gram; G6PD = Glucose-6-phosphate dehydrogenase; GI = gastrointestinal; ICP = intracranial pressure; ICU = intensive care unit; IM = intramuscular; IND = investigational new drug; INH = isoniazid; IRIS = immune reconstitution inflammatory syndrome; IV = intravenous; LP = lumbar puncture; mg = milligram; mmHg = millimeters of mercury; NNRTI = non-nucleoside reverse transcriptase inhibitor; NRTI = nucleoside reverse transcriptase inhibitor; NRTI = non-nucleoside reverse transcriptase inhibitor; NSAID = non-steroidal anti-inflammatory drugs; PegIFN = Pegylated interferon; PI = protease inhibitor; PO = oral; PORN = progressive outer retinal necrosis; PZA = pyrazinamide; qAM = every morning; QID = four times a day; q(n)h = every “n” hours; qPM = every evening; RBV = ribavirin; RFB = rifabutin; RIF = rifampin; SQ = subcutaneous; SS = single strength; TID = three times daily, TVR = telaprevir; TMP-SMX = trimethoprim-sulfamethoxazole; ZDV = zidovudine

**Evidence Rating:**

**Strength of Recommendation:**

A: Strong recommendation for the statement
B: Moderate recommendation for the statement
C: Optional recommendation for the statement

**Quality of Evidence for the Recommendation:**

I: One or more randomized trials with clinical outcomes and/or validated laboratory endpoints
II: One or more well-designed, nonrandomized trials or observational cohort studies with long-term clinical outcomes
III: Expert opinion

In cases where there are no data for the prevention or treatment of an OI based on studies conducted in HIV-infected populations, but data derived from HIV-uninfected patients exist that can plausibly guide management decisions for patients with HIV/AIDS, the data will be rated as III but will be assigned recommendations of A, B, C depending on the strength of recommendation.
